Data Analysis Hometask

Overview

Nevis is an AI platform for wealth management. There are tens of thousands of potential wealth management firms that could be great customers for Nevis. Specifically, we focus on **Registered Investment Advisory firms (RIAs)**. These RIAs are regulated by the **SEC** and must file a **Form ADV** every year. Form ADV is a mandatory disclosure document that includes information about:

- The RIA's business and services
- Types of clients they serve
- Assets Under Management (AUM)
- Headcount and staffing (including advisors)
- Other key firm characteristics

A full history of RIAs and their filing data can be found **HERE**. We have also included an example of Form ADV filing as an attachment to the email.

Task Requirements

Your task is to develop a Jupyter notebook (or equivalent, e.g., Google Colab, etc.) that correctly parses SEC ADV filing data and answers critical business questions to Nevis.

Step 1 – Parse ADV Filing Data to a Data Table

1. Parse the last 5 years of SEC ADV data for RIAs from **this link**
2. Build a clean, analysis-ready data table at the RIA-firm level that includes, at minimum, the following fields:
    a. SEC#: XXX-YYYYY
    b. Firm Name
    c. Website (e.g., www.beaconpointe.com)
    d. City
    e. State
    f. Assets Under Management (AUM), in USD
    g. Number of Clients
    h. Average AUM per Client
    i. Number of Employees
    j. Number of Advisors
    k. AUM per Advisor
    l. Filing Date / Year (to enable 1-, 3-, 5-year trend analysis)

If you believe additional fields are critical to answer the business questions below, feel free to include them and briefly explain why.

Step 2 – Answer Business Questions with Analysis

Using the data table you build, answer the following questions in your notebook (with both code and brief written commentary):

Market Segments

How many RIAs fall into each AUM market segment (using latest available year):

1. Less than $1B in AUM
2. $1B-$10B
3. $10B-50B
4. >$50B

Business Questions

Within each AUM market segment:

1. **Who are the fastest growing firms?** – What are the fastest growing RIAs (by YoY AUM growth over 1,3,5 years)?
2. **Which firms are capacity-strained?** – What firms have the highest AUM per advisor?
5. **Which RIAs appear under-staffed?** – Which firms have seen AUM grow faster than advisor headcount over 1,3,5 years?

Deliverables

Within **3 days** from issue of this assignment, please submit by emailing to philipp@neviswealth.com and mark@neviswealth.com your Jupyter Notebook and other work materials (incl repo).

Evaluation Criteria

We will assess your submission on:

- **AI utilization** - Evidence of proper usage of AI tools and techniques to perform this analysis fast, but in accurate way
- **Data handling & robustness** – How well you ingest, clean, and structure messy real-world data.
- **Analytical rigor** – Correctness of calculations, handling of edge cases, and clarity of assumptions.
- **Business insight** – How clearly you connect the numbers back to market structure and opportunities.
- **Code quality** – Readability, structure, documentation, and reproducibility of your notebook.
